

Machine Learning Engineering Bootcamp

Capstone: Deployment Implementation

Step 11

Learning Objective

- Create a production application out of the production-ready code.

Criteria	Meets Expectations	Weightage
Time Estimate	15 - 20 hours	
Completion	☐ The student has submitted a link to a production repository i.e. a Github repository with production-ready code and instructions in the README on how to run the application. (2 points)	2 points
Process and understanding	☐ The submission demonstrates that the student has a clear understanding of how to take production-ready code into deployment. Specifically: • The proposed data pipelines have been implemented; all of the data can be stored, and transported as needed to the right component(s) in the application. (1.5 points)	6 points

	• The application logs the necessary information to monitor performance and debug it in case of issues. (1.5 points) • The application is adequately 'containerized', whether by using a managed platform such as Domino or Google's Cloud ML Engine or by using Docker or similar containerization tools. (1.5 points) • The application has a sensible, well-documented, and tested API and a UI. (1.5 points)	
Presentation	❑ The Github repository has clear instructions on how to run the application. (0.5 points) ❑ When 'spun up' and run, the application can be queried easily via the API and/or the UI and returns sensible results or error messages. (1 point) ❑ The code is well-documented and well-organized, with clear instructions on how the code should be run. (0.5 points)	2 points

Excellence: The above criteria were met and

- *The code is particularly clean and elegant.*
- *The API is well-designed and well-implemented.*

- *The student has gone above and beyond in ensuring that the application is stable and scalable, even under edge cases and stress.*
